PRESS 2016 Highlights

The 2016 PRESS uses newly available data from an annual donor survey and the 2014 Creditor Reporting System (CRS) round to report on commitments to statistical capacity building between 2006 and 2014. The 2014 figures are expected to be adjusted upwards to the levels of 2011-2013 as additional projects for 2014 will be reported later this year.

\$470 M

Support to statistics amounted to USD 470 million in 2014. This was on par with the USD 448 million in commitments in 2013.

0.25%

The share of Official Development Assistance (ODA) dedicated to statistics was 0.25% in 2014, mirroring the similarly low level of 0.24% in 2013.

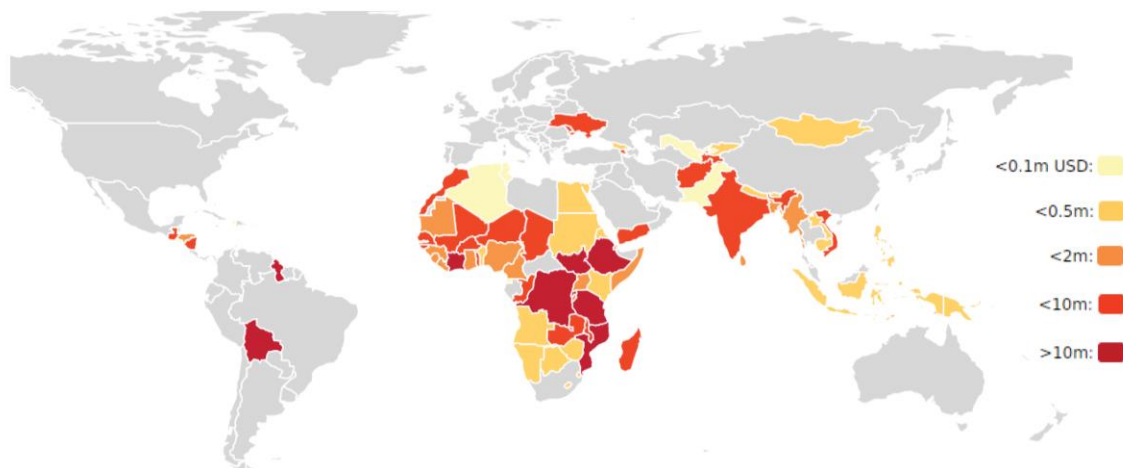

\$141 M

Demographic and social statistics receive the most support (USD 141 million), followed by economic statistics (USD 128 million) and general and methodological issues (USD 104 million).

72%

The top 5 providers of development co-operation in statistics (Canada; European Commission/EUROSTAT; FAO of the United Nations; IMF; World Bank) provided 72% of total commitments in 2014.

Beneficiaries of aid to statistics in 2014

This map is for illustrative purposes and is without prejudice to the status of the sovereignty over any territory, to the delimitation of international frontiers and boundaries and to the name of any territory, city or area.

I. Introduction

Overview

It is now widely accepted that statistics play a fundamental role in development. Several reports issued from United Nations (UN) bodies on the 2030 Agenda highlight the need for sound statistics to inform policies and measure progress. Nevertheless, this PRESS report finds that the increased focus on statistics for development is still not reflected in aid figures. In 2014, support to statistics remained relatively low, comprising a mere 0.25% of Official Development Assistance (ODA). This has wide-ranging consequences, for without timely and accurate statistics, countries will not be able to underpin effective and sustained policies, programmes and services to help lift the poor out of poverty – and keep them there.

Many countries still struggle to meet statistical demands, particularly at a time of shrinking government budgets, despite raised awareness on the importance of statistics. More effort is therefore needed to ensure developing countries have the capacity and resources to better monitor progress on their own policy objectives as well as the newly adopted Sustainable Development Goals (SDGs). The UN's push for "data for development" is a very helpful step in this direction but there is still scepticism in the development community: *The Economist* (2015), in its January 24th issue, quotes the Copenhagen Consensus Centre's Bjorn Lomborg stating that "gathering data is hugely expensive" compared to other "value for money" investments for the SDGs. Jerven (2014) even concludes that such an investment will likely have a benefit-to-cost ratio smaller than one. To convincingly demonstrate the benefit of investing in official statistics, a UNECE-convened Task Force on "The Value of Official Statistics" is currently preparing a report that reviews the evidence from existing studies and methodologies. The group estimates, for example, a return of USD 16 in increased GDP for every USD 1 invested in educational statistics (see BOX 1 in this report, for the case study). These returns are on a par with even the most optimistic "value for money" investments for the targets of the SDGs (Copenhagen Consensus Centre, 2015). Furthermore, a coalition of development experts (Espey et al., 2015) reckons that producing data to measure the SDG indicators would only require an increase in support to statistics from currently 0.25% of ODA to 0.5%, as measured by this PRESS report.

The Partner Report on Support to Statistics (PRESS) aims to provide a snapshot of ongoing worldwide financial support to statistical development and an overview of trends. This information is intended to inform discussions on current investments and facilitate collaboration among partners

for the co-ordination of resources. The PRESS report measures financial support provided by multilateral and bilateral donors covering all area of statistics ranging from national accounts to human resources and training (see Classification of Statistical Activities in the Methodological Annex for more details). PARIS21 designs and administers the PRESS exercise to inform discussions on statistics, offering insight into what support is being channelled to which countries and when.

Measuring support to statistics comes with many methodological challenges thus the financial figures presented in the PRESS need to be interpreted with these challenges in mind. For instance, PRESS numbers rely on the OECD Creditor Reporting System (CRS) for ODA commitments supplemented by voluntary reporting from additional donors. Yet, full coverage of all programmes cannot be guaranteed. Furthermore, the reported commitments can be seen as an upper bound to the actual support to statistics for three main reasons. First, double counting of projects may occur when the donor and project implementer report on the same project or when all project co-financers report project totals. Second, the reported numbers may be inflated by working with project totals for multi-sector projects, which comprise only a small statistics component. Finally, the PRESS reports on donor-side commitments which do not always translate to actual disbursements to the recipient countries.

The methodology of this report, which is detailed below, has been developed to address most of these methodological challenges. Today, the PRESS gives the most comprehensive account of how much money the international community spends on statistics, in which areas and for which regions and countries.

Within the last two years, there have been several other reports on international support to statistics, which are either based on PRESS data or complement this report. This year, the recently established Global Partnership for Sustainable Development Data (GPSDD) will produce the first *State of Development Data Financing* (SDDF) report. The 2016 SDDF (forthcoming) will specifically report on the funding gap to produce the necessary data to monitor the SDGs in the 77 IDA/Blend countries and beyond, as well as on a possible funding strategy to help fill this gap. Open Data Watch's *Inventory of Financial Instruments*¹, first published in June 2015, reviews the mechanisms of the most dominantly used funding mechanism: trust fund grants. It provides a comprehensive inventory of trust funds along with recommendations on how these can best support the data revolution for sustainable development. Since 2015, EUROSTAT has collected data on support to statistics in its annual *Donor Co-ordination Survey*. This survey is complementary to the PRESS as it focuses on recipients in other target countries, with a more limited scope on enlargement, Eastern

¹ See <http://opendatawatch.com/monitoring-reporting/aid-for-statistics/>

European, Caucasus and Central Asian (EECCA) countries, as well as Mongolia and European Neighbourhood countries in the south. The EUROSTAT report is circulated to participating donors for the purpose of co-ordination and is not publicly available online.

BOX 1: Return on Investment in Educational Statistics

Measuring the return-on-investment of statistics is riddled with methodological challenges ranging from multiple users and uses of data (so it is often not even clear where to expect impact) to the practical impossibility of running rigorous Randomised Controlled Trials (because withholding information is unethical or because of the spillover of information between treatment and control groups). Following a rare policy change in 2001, Wales stopped publishing school performance statistics while England continued. We compare a composite measure of cognitive skills (the aggregated PISA scores of Mathematics, Science and Reading) for England and Wales in 2003 (baseline) and 2009 (endline). Based on this quasi-experiment, the resulting difference-in-difference of 10 test scores corresponds to a 0.1 standard deviation improvement on the PISA scale in England compared to Wales. Hanushek and Woessmann (2012) and OECD (2010, p. 15) estimate that an increase in PISA scores by 0.1 standard deviations yields a 0.174 percentage point increase in GDP. Given England's GDP of GBP 1.38 trillion (ONS, 2015) in 2015, this results in an estimated improvement in economic production of GBP 2.4 billion ($= 0.00174 \times \text{GBP } 1.38 \text{ trillion}$) per year. In relation to the cost of the examination system run by private exam boards that charge about GBP 300 per student (i.e. $\text{GBP } 300 \times 500\,000 = \text{GBP } 150 \text{ million}$), this corresponds to an estimated return on investment of 1500% ($= (\text{GBP } 2\,400 \text{ million} - \text{GBP } 150 \text{ million}) / \text{GBP } 150 \text{ million}$) from producing the league tables. That is a return of GBP 16 for every GBP 1 invested in educational statistics.

Methodology

The PRESS exercise is conducted annually² to report on trends in support to statistics. The current report updates the PRESS 2015 results for calendar years 2006 to 2014 with CRS data for 2014. To ensure comparability over time, the methodology is applied retrospectively for all years. This section reviews the methodology.³

² The PRESS exclusively reports on years where data from both the CRS and the PRESS questionnaire is available to facilitate comparisons over time. The use of the CRS, which reports 2014 commitments in January 2016, results in a two-year time lag for the PRESS reporting. The current issue published in 2016, therefore reports on commitments to statistics up to 2014.

³ The methodology used in compiling PRESS data is described in the 2009 PRESS methodology report at <http://www.paris21.org/sites/default/files/PRESS2009-methodology.pdf>.

The PRESS methodology uses a text mining technique to identify statistics projects in the CRS database that are not currently labelled as support to statistics. This approach avoids double counting projects as CRS is the only data source used for DAC members.

The aim of the PRESS is to provide a full picture of international support to statistics. To this end, the report draws on three distinct data sources. The first source of data is the OECD Creditor Reporting System (see BOX 2), which records data from OECD Development Assistance Committee (DAC) members and some non-DAC donors, and provides a comprehensive accounting of ODA. Donors report specific codes for the sector targeted by their aid activity. Statistical capacity building (SCB) is designated by code 16062. Second, when SCB is a component of a larger project, it is not identified by this code, causing the CRS figures to underestimate actual levels of support for international aid. PARIS21 seeks to reduce this downward bias by searching project descriptions in the CRS for terms indicating a component of SCB. This data source is new and the methodology is presented in BOX 3. Third, and finally, the PARIS21 Secretariat supplements this data with an online questionnaire completed by a global network of reporters. The questionnaire covers a subset of the variables collected in the CRS and some additional variables specific to statistical capacity building. Reporting to the questionnaire is voluntary, offering an opportunity for actors to share information on their statistical activities. Reporters to this questionnaire are countries that do not report to the CRS, as well as multilateral institutions with large portfolios of statistical projects that have requested to report to the PARIS21 Secretariat directly.

BOX 2: The Creditor Reporting System

The CRS is the official source of information on aid commitments from OECD member countries, as well as a number of multilateral organisations. It was established in 1967, jointly by the OECD and the World Bank, with the aim of providing participants with a regular flow of data on indebtedness and capital flows.

Calculating capital flows and debt stock remain key functions of the System but others have evolved over the years. In particular, the CRS aid activity database has become the internationally recognised source of data on the geographical and sectorial breakdown of aid and is widely used by governments, organisations and researchers active in the field of development. It is updated on an ongoing basis in accordance with the relevant directives. The PRESS draws on the ODA portion of the database, which includes both geographic and sectorial information on projects, to identify those targeting statistics. The CRS also includes data on Other Official Flows and Official Export Credits.

Source: OECD (2007)

The recipient countries⁴ covered in the PRESS exercise fall into four categories: those eligible to borrow from IDA,⁵ lower income countries (LIC), lower middle income countries (LMIC) as defined by OECD DAC,⁶ and all African countries. Although PARIS21 activities and reporting focus on the least developed countries, African upper middle income countries are included in this exercise because the 2006 Light Reporting Exercise (LRE) — the process that evolved into the PRESS — reported on support to statistics across the entire African continent. By retaining all African countries in the PRESS users interested in statistical development in Africa are able to sketch trends back to the original LRE. The complete list of countries is available in the Methodology Annex below. Support that is not country-specific is shown in the tables below under the category “unallocated.”

BOX 3: Identification of Commitments to Statistics in the CRS

The project descriptions in the CRS database are searched for statistics components by applying two filters: a set of 150 keyword sequences (and their permutations) in three languages and 20 sector codes to control for context. More than 90% of project descriptions are in English, French and Spanish so these languages have been selected as filters. For the selected sectors, projects are considered to have a significant statistics component if their project description contains at least one keyword sequence per 50 words.

Keyword sequences indicating a statistics component are identified in a three-stage process. First, project descriptions are split by language, common words such as ‘the’, ‘is’, and ‘at’ are removed and the remaining words are reduced to their word stem. Second, for each language, word sequences, such as ‘statist capac’ for statistical capacity, are identified as related to statistics if these sequences are at least four times more likely to appear in projects that were labelled as support to statistics (designated by purpose code 16062) than in those that were not. Third, word sequences are verified manually by analysing the corresponding sentences.

The limitation of the analysis to 20 sector codes allows for further context specific control. For instance, projects in the ‘mineral prospection and exploration’ sector use ‘geospatial data’ from ‘field surveys’ but do not contribute to a country’s statistical capacity. The analysis therefore only considers sector codes that are frequently reported together with sector code 16062 for statistics. The most relevant sector, with 54% of projects identified, is ‘Population policy and admin management’ which includes support for census and civil registration, followed by ‘Public sector policy and admin management’ (15%) and ‘Multi-sector aid’ (12%).

⁴ This document and all maps included herein are without prejudice to the status of or sovereignty over any territory, to the delimitation of international frontiers and boundaries and to the name of any territory, city or area.

⁵ The list of IDA borrower countries (<http://www.worldbank.org/ida>) is periodically updated. This report reflects countries with IDA borrowing status as of October 2014.

⁶ This report includes countries with LMIC status according to the October 2014 DAC list of Official Development Assistance recipients (<http://www.oecd.org/dac/stats/daclist.htm>), which is updated every three years.

Use cases and best reporting practices

The figures reported in the PRESS provide an upper limit to the actual support to statistics. This reporting is useful to convincingly demonstrate that support to statistics remains extremely low. To move closer to the actual support to statistics, the PARIS21 Secretariat has identified and implemented several best practices in reporting. This section upholds these best practices using three recent use cases of the PRESS data: (i) estimating funding gaps in statistics, (ii) monitoring SDG Target 17.19 and (iii) determining countries' absorptive capacities.

To provide an accurate picture of support to statistics, reporters to the PRESS questionnaire indicate their role in a project to flag multiple reporting from donors and implementers. CRS reporters break down their projects by sector to help identify statistics components in multi-sector projects.

A first use case of the PRESS comes from the Needs Assessment for SDG monitoring⁷, co-ordinated by the Sustainable Development Solutions Network (SDSN) in collaboration with PARIS21, Open Data Watch and others in early 2015. This exercise aimed to establish the funding gap to produce the data required to monitor the SDGs in the 77 IDA/Blend countries.⁸ The PRESS headline number of global commitments to statistics was a major input on the supply side of funding. However, to ensure the global numbers are accurate, it is necessary to correct the double counting of aid that arises when donors and implementing agencies report the same project twice. To circumvent this issue, multilateral reporters to the PRESS questionnaire indicate their role as “implementer” (vs. “donor”) when they manage or implement a project financed by another donor. Such reporting allows the PARIS21 Secretariat to ensure that these commitments appear only once in the global number, resulting in a more accurate estimate.

Another use case of the PRESS headline number is the monitoring of the indicator for SDG Target 17.19: “Financial and other resources made available to strengthen the statistical capacity in developing countries” at the country level. However, a limitation of the CRS is that it does not allow reporters to enter a list of recipients when reporting on multi-recipient projects. It is thus unclear which share of the support goes to a specific country. To solve this problem of identification, some CRS reporters already split their projects into sub-projects – one per recipient country – with each carrying their respective share of the total project commitment. The same reporting practice is followed to indicate what share of a multi-sector aid project goes to statistics. PARIS21 encourages

⁷ See <http://unsdsn.org/resources/publications/a-needs-assessment-for-sdg-monitoring-and-statistical-capacity-development/>

⁸ See <http://data.worldbank.org/about/country-and-lending-groups>

this practice and has incorporated it in its methodology to ensure the successful measurement of resources available to strengthen statistical capacity at the country level.

Finally, the PARIS21 Road Map for a country-led data revolution⁹, the Needs Assessment for SDG monitoring and others are now calling for a doubling of support to statistics. To assess countries' absorptive capacity to make effective use of such an increase in funding, the reporting needs to go beyond commitments of international aid. Two measures for a country's absorptive capacity are actual disbursements (as opposed to commitments) of aid money and domestic resources already invested in support to statistics. To give a clearer picture of these measures, the PARIS21 Secretariat provides technical support to countries to produce a budget as part of the National Strategies for the Development of Statistics (NSDS)¹⁰ and to undertake Country Reports on Support to Statistics (CRESS).¹¹

II. Summary of the main findings from PRESS 2016

1. The 2016 PRESS uses newly available data from an annual donor survey and the 2014 Creditor Reporting System (CRS) round to update figures on aid to statistics for 2006-2013 (previously reported in the 2015 PRESS) and report new figures for commitments in 2014. The 2014 figures are expected to be adjusted upwards to the levels of 2011-2013 as additional projects for 2014 will be reported later this year. All findings should therefore be interpreted with this caveat in mind.

Trends in PRESS 2016

Figure 1. Global Commitments to Statistics. Total amount by data source

Link to Figure Data: [PRESS 2016 Figure Data](#)

Figure 2. Global Commitments to Statistics. Per capita and as percentage of ODA

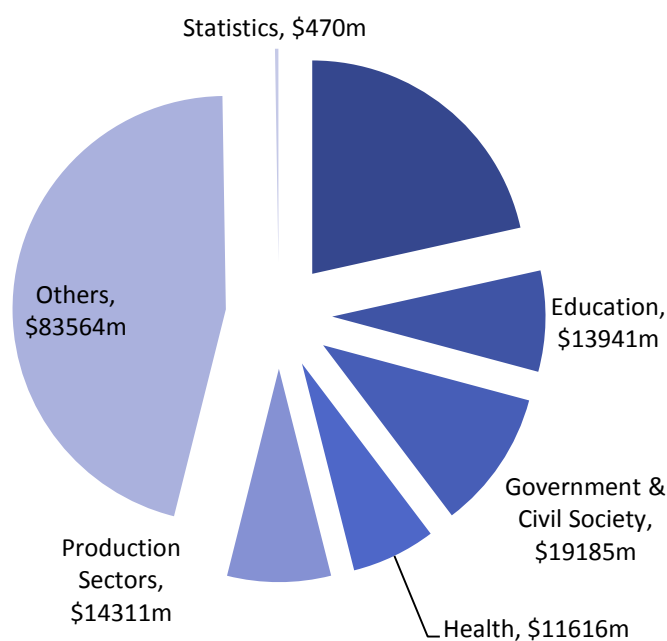

Link to Figure Data: [PRESS 2016 Figure Data](#)

2. **Support to statistics remains low.** 2014 commitments to statistical development of about USD 470 million show a 20% decrease from 2011 and 2013 (see Figure 1). This decrease led to a drop in the share of ODA dedicated to statistics from 0.31% in 2012 and 2013 to 0.25% in 2014. This should, however, not be interpreted as a general trend because commitments often span multiple years and fluctuations in annual figures are therefore common. Overall, it appears that global commitments remained constant over the last three years (2011-2013). In 2014, commitments also decreased in per capita terms, falling from USD 0.17 in 2013 to USD 0.14 in 2014 (Figure 2).¹² This change was caused by two phenomena: first, a global decrease in total commitments in 2014 (\$470M compared to \$577M in 2013); second, a peak in 2013 that can be explained by changes in the PRESS coverage. In 2013, a total of 11 countries (i.e. Albania, China, Colombia, Dominican Republic, Ecuador, FYR of Macedonia, Iran, Jordan, Niue, Peru and Thailand) changed status from LMICs to Upper Middle Income Countries (UMICs), and hence have not been covered in reporting for the last two years. In turn, populations covered by the PRESS decreased from 5 billion in 2012 to 3.4 billion in 2013 and 2014. The total amount of aid to statistics remains negligible when compared to other sectors¹³ of ODA such as 'Education' or 'Health'. Figure 3 illustrates that Statistical Capacity Building comprises only a small portion of the share of ODA sectors, about 0.25%.

¹² Population figures are drawn from the UN Population Division. See <http://esa.un.org/wpp/Excel-Data/population.htm>

¹³ Sectorial categories and data taken from the CRS.

Figure 3. Share of Sectors on ODA, 2014

Link to Figure Data: [PRESS 2016 Figure Data](#)

3. **The reported alignment of commitments with National Strategies for the Development of Statistics (NSDSs) remains at a high level.**¹⁴ Between 2012 and 2014, the share of commitments reportedly aligned with an NSDS drops from 86% to 78% but remains at an overall high level (see Figure 4).

Figure 4. Alignment of Projects with NSDS

Link to Figure Data: [PRESS 2016 Figure Data](#)

¹⁴ For details on the status of NSDSs in specific countries see most recent PARIS21 publication NSDS Progress Report at www.paris21.org/nsds-status

BOX 4: What is a National Strategy for the Development of Statistics?

A National Strategy for the Development of Statistics (NSDS) is undertaken to provide a country with a strategy for developing statistical capacity across the entire national statistical system (NSS). The NSDS will provide a vision of where the NSS should be in five to ten years and will set milestones to achieve this vision. It will present a comprehensive and unified framework for the continual assessment of evolving user needs and priorities for statistics, and for building the capacity necessary to meet these needs in a more co-ordinated, synergistic and efficient manner. It will also provide a framework for mobilising, harnessing, and leveraging resources (both national and international), and a basis for effective and results-oriented strategic management of the NSS.

As of January 2016, of the 77 IDA borrowers, 42 are currently implementing their strategies. A total of 93.5% are currently engaged in an NSDS process. In Africa, 36 of the 40 IDA countries on the continent are designing or implementing a statistical strategy.

Source: <http://www.paris21.org/NSDS>

4. **Multilateral, country-specific assistance remains the most popular means through which donors channel support to countries.**^{15,16} Figure 5 shows that support from multilateral bodies accounted for less than 50% of total aid to statistics in 2009-2010 but increased to approximately 70% in 2011 and 2012, respectively. However, the shares of country-specific aid diminished slightly between 2012 and 2014.

Figure 5. **Allocation of Aid to Statistics**

Link to Figure Data: [PRESS 2016 Figure Data](#)

¹⁵ Multilateral support in this context refers to support coming from multilateral institutions, and country-specific assistance refers to projects for which there is a single country recipient.

¹⁶ The interested reader is referred to Open Data Watch's Inventory of Financial Instruments which provides further information about options for channelling aid funds at <http://opendatawatch.com/monitoring-reporting/aid-for-statistics/>

5. **The target of statistical support is shifting with a relative growth in support to demographic and social statistics** compared to 2006 and 2007, the first years of reporting, (from USD 37 million to USD 141 million in 2014). Economic Statistics have always been among the dominant categories, accounting for USD 128 million in 2014. Strategic and managerial issues accounted for the third largest amount, USD 104 million. Figure 6 shows the breakdown of aid to statistics across areas of statistical development.

Figure 6. **Areas of Aid to Statistics**

Link to Figure Data: [PRESS 2016 Figure Data](#)

The numbers in Figure 6 reflect the absolute dollar amount of commitments for each area while the bars indicate the relative share of commitments in the respective area. Since commitments can fulfil multiple purposes, the numbers each year will not necessarily add up to the total number of commitments.¹⁷

¹⁷ The purpose of a commitment is reported according to the statistical categories based on the “Classification on activities in the domain of Statistical capacity building, adjusted for the reporting of donor and recipient activities”, developed by an inter-agency task team that defined PRESS methodology. This classification is largely based on the Classification of Statistical Activities used in the United Nations Economic Commission for Europe’s (UNECE) Database of International Statistical Activities, and, since 2009, for the list of subject matter domains in the Content-oriented Guidelines, produced by the SDMX (Statistical Data and Metadata eXchange) initiative. For more details, see the Methodological Annex.

Key findings by recipient

6. **The distribution of support among regions has also changed compared to 2013, reflecting trends in earlier years of reporting.** Africa received the largest share of total support with 58% (USD 237.7 million), whereas in 2013, almost half (42%) of reported commitments went to Asia-Pacific. This was mostly due to the development of the Bangladesh Poverty Database, which made up 25% of support to Asia. In 2014, Latin America and the Caribbean received 13% of total statistical support, equivalent to USD 52 million, Eastern Europe 8% (USD 34.1 million) and Asia-Pacific 7% (USD 29.5 million). A further 14% (USD 55.7 million) was committed to global projects and programmes that were not country-specific. Previous PRESS reports show that Africa has historically received the lion's share of statistical support. The 2013 shift towards Asia-Pacific should not be overstated given that it is driven by big multi-year commitments which would explain the volatility.

Figure 7. Commitment in 2014, by Geographical Region

Link to Figure Data: [PRESS 2016 Figure Data](#)

7. **Support to statistics remains concentrated** on certain countries with the top 25 recipients receiving more than 60% of support. Countries in this ranking reappear from year to year: 15 of the top 25 recipients have been on the list at least three times. A similar concentration was observed in the top five recipients in per capita terms between 2006 and 2014: while countries like Tanzania, Bolivia and Rwanda rank high in total terms, small islands states like Niue, Tuvalu and Dominica dominate the top five in per capita terms.

Figure 8. Top Five Recipients of Country-specific Aid

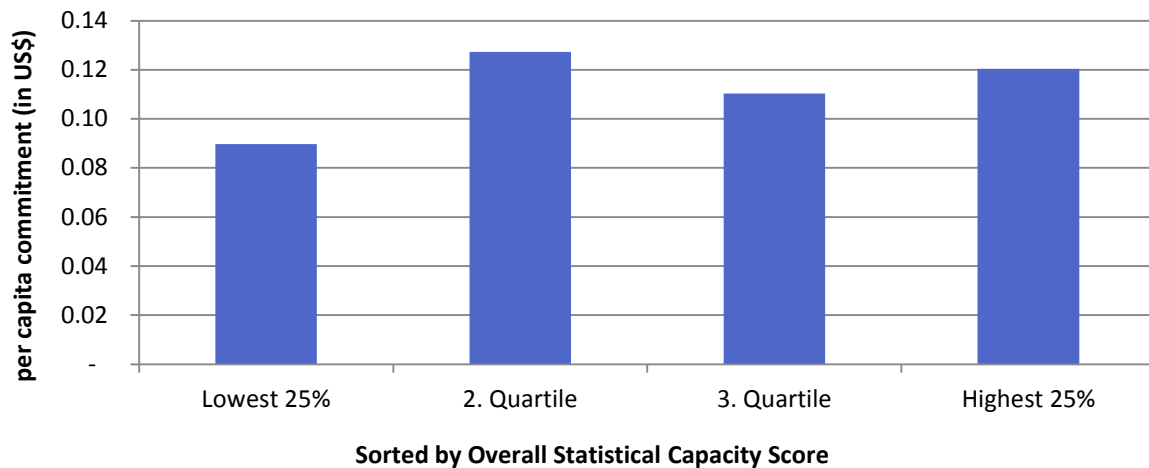

Link to Figure Data: [PRESS 2016 Figure Data](#)

8. **Countries with the lowest statistical capacity do not always receive the most support.** By matching the figures on commitments with the World Bank country statistical capacity scores,¹⁸ one can begin to determine whether a relationship exists between the volume of statistical support provided to countries and their need to develop capacity. Drawing a correlation between the two variables can be deceptive, as support to statistics often depends on multiple factors such as actual funding needs of each individual country and probably shows a time lag in impact. Nevertheless, PRESS data and the World Bank's scores can provide an initial view of the situation. Countries receive roughly the same levels of support, whatever their overall statistical capacity score, with about USD 0.12 per capita above the second quartile. However, countries in the lowest quartile of the distribution received less funding per capita (USD 0.09) than countries with high scores (USD 0.12).

¹⁸ On an annual basis, the World Bank updates its "country-level statistical capacity indicator based on a set of criteria consistent with international recommendations." This indicator – on a scale of 0 to 100 – is available for more than 140 countries. See <http://bbosc.worldbank.org>. This excludes those PRESS countries for whom the World Bank has not calculated a statistical capacity score (DR Korea, Kosovo, South Sudan and Tuvalu).

Figure 9. Average per Capita Commitment in 2014

Link to Figure Data: [PRESS 2016 Figure Data](#)

Small Island Developing States

9. **Small Island Developing States (SIDS)¹⁹ receive the highest levels of support in per capita commitments**, though this is not reflected in absolute values. In the past three years (2012-2014), SIDS covered in the PRESS received total commitments worth approximately USD 44 million. In comparison, countries with a number of inhabitants close to that of all SIDS combined (i.e. approximately 26.2 million for the 25 SIDS covered this year) such as Nepal (USD 1.7 million) and Iraq (USD 1.2 million) received less; one exception being Afghanistan where commitments amounted to USD 41 million.

Figure 10. Small Island Developing States with > USD 1 million of Commitments in 2012-14

Link to Figure Data: [PRESS 2016 Figure Data](#)

¹⁹ For the purposes of this report, the definition for a Small Island Developing State (SIDS) is drawn from the United Nations. See <http://www.sids2014.org/index.php?menu=1496>

Fragile States

10. **Fragile states²⁰ receive considerable attention from the statistical development community.** Currently, all 36 fragile states are included in the PRESS with commitments of USD 553 million reported between 2012 and 2014. This represents over one-third of all country-specific commitments in this period worldwide (USD 1,163 million). Afghanistan, Central African Republic, Yemen and Myanmar combined received more than a third (38%) of all statistical aid to fragile states. Figure 11 shows the support to all fragile states that received more than USD 10 million in commitments.

Figure 11. **Fragile States with > USD 10 million of Commitments in 2012-14**

Link to Figure Data: [PRESS 2016 Figure Data](#)

Methods of Financing

11. **Grants remain the main financing instrument.** Although the main financing instrument employed by donors remains grants, the choice between grants and loans/credit differs widely across regions. In Latin America and the Caribbean, 60% of the total volume of aid was provided as loans/credits between 2006 and 2013 but in Africa only 18% of aid during the same period was in the form of loans/credits. The opposite can be observed for grants. Obviously, unallocated commitments are predominantly distributed as grants.

²⁰ For the purposes of this report, the definition for fragility and the identification of countries satisfying those criteria are drawn from the World Bank's harmonised list of fragile states. See <http://go.worldbank.org/BNFOS8V3S0>.

Key findings by provider of development co-operation

12. **A large share of global support to statistics continues to come from a very small number of providers.** The top five providers of development co-operation in statistics (Canada; European Commission/EUROSTAT; FAO; IMF; World Bank) provided 72% of total commitments in 2014. While Canada is strongly engaged in country-specific aid to statistics, the United Kingdom and Norway are among the top donors for unallocated commitments. Unallocated commitments accounted for approximately 26% (USD 116 million) in 2014. Figures 13 to 15 illustrate support from the top five providers for each category.

Figure 15. Top Five Donors, Unallocated Commitment in 2014

Link to Figure Data: [PRESS 2016 Figure Data](#)

13. **In conclusion**, this report presents data on the support to statistics up to 2014. The increased interest in statistics due to 2030 Agenda and the SDGs will hopefully translate into stronger commitments in the future. The 2030 Agenda was published in 2013 and funding programmes will need some time to shift priorities, which the PRESS should be able to reflect in the 2017 and 2018 editions.
